

J. v. G. final visual module inspection

Insert Panel

System description

The module inspection is available for three options (frameless and framed modules)

Visual inspection of framed modules

Panels can be easily flipped for visual inspection. The panel is transported lengthwise on rollers / toothed belts. They are adjusted for maximum width (the width is adjustable). Lateral guides support the motion of the panel. The panel is pneumatically secured to the conveyor rollers or belts so it can safely be rotated through 110° for easy inspection of the panel's sunnyside.

J.v.G. Visual laminate inspection

System description

Inspection of frameless panels is equipped with a mirror underneath. The panel is transported lengthwise. Both toothed belts are adjusted for maximum width (the width is adjustable). Lateral guides support motion of the panel and feature bevels for easy insertion. Non-glare lighting illuminates the module from underneath.
